G. KELLER, DUXBURY PRESS, 2005.**

Student Learning Objectives/Outcomes:

- 1) Be able to organize and summarize raw data**
- 2) Be able to build and evaluate a regression model from raw data**
- 3) Be able to apply the basic rules of Probability Theory**
- 4) Be able to apply the concept of a random variable to solve business problems**
- 5) Be able to apply the Normal, Poisson, and Binomial Distributions to solve business Problems**
- 6) Be able to simulate data from the Normal, Poisson, and Binomial Distributions**
- 7) Be able to identify significant changes in averages and proportions**
- 8) Be able to determine if two populations have the same mean or the same proportion**
- 9) Be able to determine if several populations have the same mean**

Grades:

Course grade is based solely on three case studies (take-home examinations) given at the end of each module described below. There is no final exam. Each exam will be graded on the following scale:

A	94 – 100
B	87 – 93
C	75 – 86

The final grade is the arithmetic average of the scores on the three exams.

Textbook practice problems for each section are suggested below. These are designed to help you understand the techniques and concepts introduced in the course and their completion does not count toward your grade.

Supplementary Materials:

Lecture notes for the course and EXCEL files that will be used in the lectures can be downloaded from my web site www.utdallas.edu/~wiorkow/

Class Procedure:

Each module corresponds to approximately 12-15 hours of classroom time.

This course assumes that you are using a computer statistical package to implement the statistical procedures. All lectures use Microsoft EXCEL for illustrative purposes.

You are responsible for the material covered in the class sessions, a small portion of which is not covered in the text book. Conversely, you are not responsible for material in the text book not covered in the lectures.
