Course description

This is an introductory course to the theory of ordinary differential equations (ODEs). Topics to be covered include: first order differential equations, second order linear equations, Laplace transform techniques, systems of first order linear equations, nonlinear systems.

Student Learning Objectives

1. Students will be able to identify different methods of solving differential equations and apply them to obtain solutions for various classes of differential equations.

2. Students will be able to apply their knowledge of differential equations to construct and analyze models arising in applications in mathematics, physics, engineering, population dynamics.

3. Students will be able to perform quantitative and qualitative analysis of problems described by differential equations.

Assignments, quizzes and exams

Assignments: There will be weekly assignments. Those are NOT for grade.
Quizzes: There will be a weekly quiz during the problem session organized and marked by the teaching assistant.
Exams: There will be three common examinations. All sections take examinations together. Textbooks, notes, calculators or other electronic devises won't be allowed during examination. However, a half-page (one side only) hand written formula sheet (letter size) will be allowed on the **final exam**. The midterm and final examinations have been scheduled as follows:

	Week day	**Time**	**Room**	**Date**
